

Antanas Kairys, PhD. - "Time perspective: theory and research."

Joma: Akadēmiskā

Rīgas Stradiņa universitāte

Time is a very important concept in almost every field of science. In psychology, we analyze various aspects of subjective experience of time as many domains of personality functioning have a temporal aspect, for example, memories, hopes, identity, goals. Among phenomena related to the subjective experience of time, the concept of time perspective received much attention. Finding its roots in theory of K. Lewin and popularized by P. Zimbardo, the theory of time perspective is currently an active and interesting field of study. The presentation will summarize key points of time perspective theory, such as the nature of time perspective, time perspective dimensionality and idea of balanced time perspective. In the second part of the presentation, the issues of measurement of time perspective will be discussed. During the last part of talk, a review of key findings of some empirical studies will be presented.
